

DOCUMENTATION

CVE SEARCH APP

APPROACH:

1. I have used Flask (Python Framework) for this CVE Search Application
2. Initially, I got the API from NIST for its NVD
3. I created a constant value as NVD_API_KEY to store the API key and NVD_BASE_URL for the base url provided by NIST
4. I have defined a function query_nvd() where it gets the response using the request module with get() method where the NVD_BASE_URL is provided as parameter,
5. Then, I have defined a function called index() that renders the "index.html"
6. The search_cve_api() takes in the "cveId" and checks the vulnerabilities list index[0] That gives us the values related to CVE.
7. We return the final values using the "jsonify()" the values are returned as json objects
8. The list_cves_api() function lists the fetched CVEs informations.
9. Initially 10 records are fetched then when clicked next next 10 records are fetched.

CHALLENGES FACED:

1. I faced challenges when I tried to dump all the data into the Local SQLite database.
2. I did declare models.py but I could not accomplish dumping cve_details.db

RESULT

1. Successfully fetched the Specific Information on CVE IDs.
2. Successfully listed the fetched data 20 per page and I have implemented Pagination.
3. Tried to write clean and efficient code as possible.

SCREENSHOTS

CVE ID: CVE-1999-0067

Status: Modified

Published: 1996-03-20T05:00:00.000

Last Modified: 2024-11-20T23:27:45.950

Descriptions:

phf CGI program allows remote command execution through shell metacharacters.

CVE ID: CVE-1999-0095

Status: Modified

Published: 1988-10-01T04:00:00.000

Last Modified: 2024-11-20T23:27:50.607

Descriptions:

The debug command in Sendmail is enabled, allowing attackers to execute commands as root.
El comando de depuración de Sendmail está activado, permitiendo a atacantes ejecutar comandos como root.
